Inflight internet connectivity refers to the technology that allows passengers to access the internet while on board an aircraft. This is achieved through either satellite-based systems or air-to-ground networks. Satellite systems connect to the aircraft via antennas installed on the plane, which communicate with satellites orbiting the Earth, providing internet coverage even over oceans or remote areas. Air-to-ground systems, on the other hand, use cellular towers on the ground to establish a connection with the plane. Inflight internet enables passengers to browse the web, stream content, send emails, and use online communication services while traveling, enhancing the overall inflight experience. Many airlines offer this service, either free or for a fee, as part of their efforts to improve passenger comfort and convenience.
