The global Infrared Body Temperature Detection System market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Infrared Body Temperature Detection System is a technology solution used for the non-contact monitoring and measurement of human body temperatures. This system employs infrared sensors and cameras to detect and record the thermal radiation emitted by individuals. It is commonly utilized in various settings, including healthcare facilities, airports, transportation hubs, public events, and workplaces, to identify individuals with elevated body temperatures, which may be indicative of illness or fever.

The demand for Infrared Body Thermometers surged during the COVID-19 pandemic as they became essential tools for mass temperature screening at airports, healthcare facilities, workplaces, and public events. This heightened awareness of non-contact temperature measurement is expected to have a lasting impact on the market. Manufacturers are continually developing and improving the technology behind Infrared Body Thermometers. This includes enhanced accuracy, faster readings, and the integration of features like data logging and connectivity to smartphones and other devices.In response to public health emergencies, governments and health authorities may implement regulations requiring temperature checks in certain settings, further driving the demand for Infrared Body Thermometers.
