The single-line production capacity is approximately 2,500 pieces/month, with an average gross profit margin of approximately 35-50%.Infrared Display Card is devices that convert invisible infrared light into visible light. They are used for detecting, tracking, and calibrating infrared beams and are commonly used in beam detection for semiconductor lasers, YAG lasers, and other applications. Their core principle is to utilize special fluorescent materials to absorb infrared energy and release it as visible light upon excitation, allowing users to visually visualize the location and approximate size of the infrared spot.

The upstream core of Infrared Display Card is the supplier of specialty phosphors and optical-grade substrates. Their downstream applications are directly applied in areas such as optical path calibration for semiconductor lasers and YAG lasers, debugging military infrared equipment, beam visualization in scientific research experiments, and auxiliary inspection for industrial thermal imaging systems.

United States market for Infrared Display Card is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
