Infrared fluorescent ink is a type of ink that emits fluorescent light in the infrared spectrum when illuminated with ultraviolet (UV) light. It contains special compounds called fluorophores that absorb UV light and re-emit it as longer-wavelength infrared light, which is invisible to the naked eye. This unique property makes infrared fluorescent ink ideal for covert security applications. It can be used in printing secure documents, currency, labels, or packaging to incorporate hidden, tamper-evident, or authentication features that can only be detected or verified using infrared imaging or detection devices.

The industry trend of infrared fluorescent ink is driven by increasing demands for advanced security solutions and counterfeit deterrence. As counterfeiting methods become more sophisticated, there is a need for enhanced security features that are difficult to replicate or counterfeit. Infrared fluorescent ink offers a covert and effective means of incorporating authentication features. The trend includes continual advancements in ink formulations to achieve improved fluorescence efficiency, longer emission wavelengths, and compatibility with different printing processes. Additionally, there is a growing focus on integrating infrared detection capabilities in document scanners, authentication devices, and imaging systems to ensure reliable detection and verification of infrared fluorescent ink features.
