Abstracts

The global Infrared (IR) Cameras market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Infrared (IR) Cameras are imaging devices, which forms images based on thermal or infrared radiation, similar to common camera, which forms images using visible light and then converts into electronic signal, which is then processed to produce a thermal image and perform temperature calculations. Infrared cameras generate monochrome images because the image sensors used in Infrared cameras does not distinguish different wavelengths of infrared radiation. Infrared cameras not only monitor thermal performance but also identify and evaluate severity of heat related problems.

Development of high-speed infrared cameras with suitable sensors for measuring temperature and evaluating the relative severity of heat is a driver that contributes to the growth of infrared imaging market.
