An infrared metalens is a type of lens made from nanostructured metallic materials that can manipulate and control infrared light in a more efficient and compact way than traditional lenses. These metalenses can focus, steer, or filter infrared light at different wavelengths, allowing them to be used in a wide range of applications, such as thermal imaging, night vision technology, and telecommunications.

The key advantage of infrared metalenses is their ability to be much thinner and lighter than conventional lenses, while still providing high levels of performance. They are also more durable and resistant to environmental factors, making them ideal for use in harsh conditions.

Infrared metalenses are still a relatively new technology, but they show great promise for revolutionizing the field of infrared optics and enabling the development of innovative devices and systems. Further research and development in this area are ongoing to improve the performance and capabilities of these groundbreaking lenses.

The global Infrared Metalens market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
