The infrared oil-in-water analyzer is a water quality monitoring device based on infrared absorption spectroscopy (non-dispersive infrared technology, NDIR), which is used to quickly detect the content of petroleum, grease and other hydrocarbons in water (the measurement range is usually 0-1000 mg/L). Its working principle is to use the characteristic absorption peak of oil substances at a wavelength of 3.4?m, and quantitatively analyze them through optical sensors. It is suitable for online monitoring in the fields of industrial wastewater, marine environment, municipal drainage and petrochemical industry. The device has the advantages of strong anti-interference, no extraction, real-time detection, etc., and complies with international standards such as EPA 413.2 and ISO 9377-2.
