Infrared spectrum thermal radiation therapy instrument is a physical therapy device that uses the thermal effect of infrared rays to treat various diseases. It can promote local blood circulation, increase tissue metabolism, relieve pain, and promote tissue repair and recovery through infrared radiation. Infrared rays have different wavelengths and can be divided into near infrared rays (short wave infrared rays) and far infrared rays (long wave infrared rays). Near-infrared rays have strong penetrating properties and can directly heat deep muscles and blood vessel tissues, with good therapeutic effects; far-infrared rays have weak penetrating properties and are mostly absorbed by the superficial skin, resulting in poor therapeutic effects. Infrared spectrum thermal radiation therapy equipment usually consists of infrared emitter, controller and bracket. Infrared spectrum thermal radiation therapy equipment has a certain auxiliary therapeutic effect, but it also has some indications and contraindications and cannot be used casually. It is mainly suitable for pain caused by aseptic inflammation, recovery from sprains or falls, bedsores, chronic ulcers, post-burn infections, etc. It is not suitable for conditions such as fever, tumors, acute sprains, and short-term postoperative periods. When using infrared spectrum thermal radiation therapy equipment, you should follow the doctor's guidance and choose the appropriate infrared wavelength, power, irradiation time and distance to achieve the best therapeutic effect.

The global Infrared Spectrum Thermal Radiation Therapy Device market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
