Inhalation and nasal drug delivery devices are pharmaceutical technologies designed to administer medications directly to the respiratory system through inhalation or nasal routes. These devices include inhalers, nebulizers, nasal sprays, and nasal inhalers, each tailored to deliver specific types of medications such as bronchodilators, corticosteroids, antihistamines, or decongestants. Inhalation devices are commonly used to treat respiratory conditions such as asthma, chronic obstructive pulmonary disease (COPD), and cystic fibrosis, delivering drugs directly to the lungs for rapid absorption and localized therapeutic effects. Nasal drug delivery devices, on the other hand, are used to administer medications to the nasal mucosa for the treatment of allergies, sinusitis, nasal congestion, or systemic conditions. These devices offer advantages such as targeted drug delivery, fast onset of action, reduced systemic side effects, and improved patient compliance, making them valuable tools in the management of respiratory and nasal diseases.

The global Inhalation and Nasal Drug Delivery Devices market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
