Isoflurane is a widely used inhalational anesthetic agent employed in general anesthesia. It is a halogenated ether with the chemical formula $C_2H_2ClF_2O$, and it functions by inducing a reversible loss of consciousness and sensation in patients undergoing surgical procedures. Isoflurane acts on the central nervous system by enhancing the inhibitory effects of neurotransmitters and disrupting neural pathways that mediate awareness and sensation. It is favored in clinical settings due to its stable cardiovascular effects, ease of control, and minimal metabolism by the liver. Its administration requires specialized equipment to ensure accurate delivery and maintenance of the desired anesthetic depth.

The global Inhalational Isoflurane market size is projected to grow from US\$ 20.5 million in 2024 to US\$ 26.5 million in 2030; it is expected to grow at a CAGR of 4.3% from 2024 to 2030.
