## Abstracts

The global Inhibitor of  $\kappa$ B market size is predicted to grow from US\$ 1081 million in 2025 to US\$ 1516 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

$\kappa$ B inhibitors refer to a class of compounds or biomolecules whose main function is to inhibit the activity of the nuclear factor  $\kappa$ B (NF- $\kappa$ B) signaling pathway. NF- $\kappa$ B is an important transcription factor that participates in regulating gene transcription in cells and affects physiological processes such as cellular inflammation, immune response, and cell proliferation. In the inactive state, NF- $\kappa$ B remains in the cytoplasm by binding to the Inhibitor of  $\kappa$ B (I $\kappa$ B) protein. When stimulated (such as inflammatory factors, bacterial infection, etc.), the I $\kappa$ B protein will be degraded, leading to the activation and translocation of NF- $\kappa$ B into the nucleus, thereby regulating the transcription of downstream genes.

The  $\kappa$ B inhibitors market is showing a steady growth trend globally. This is mainly due to its wide application in the fields of inflammatory diseases, autoimmune diseases, and cancer. With the deepening of medical research, the application potential of  $\kappa$ B inhibitors in the treatment of more diseases has been continuously explored, providing impetus for market growth. Secondly, the research and development of  $\kappa$ B inhibitors continues, and new drugs continue to emerge. These new drugs have improved efficacy, safety, and indications, providing patients with more treatment options. At the same time, with the development of new technologies such as gene editing and immunotherapy, the research and development of  $\kappa$ B inhibitors has also shown a diversified and personalized trend. In summary, the  $\kappa$ B inhibitor market shows a steady growth trend.
