Initiator CNP (CAS No. 26748-47-0) belongs to the class of low-temperature organic peroxide initiators known as peroxyneodecanoates. It is typically supplied in the form of a 50% water-based emulsion or a 75% solution, and is primarily utilized in the polymerization or copolymerization of monomers such as vinyl chloride, vinylidene chloride, and ethylene.

The upstream supply chain primarily comprises neodecanoic acid (or neodecanoyl chloride), cumyl alcohol (or cumene derivatives), hydrogen peroxide, caustic soda, solvents, emulsifiers, and stabilizers; among these inputs, the neodecanoic acid-based raw materials determine the acyl structure. Midstream enterprises manufacture the finished product through a process involving controlled low-temperature reactions, purification, dilution, emulsification, and stabilization. Downstream applications are predominantly found in the polymerization of materials such as PVC, PVDC, and LDPE.

In 2025, global sales volume is projected to reach approximately 1,900 tons, with an average price of \$7,490 per ton; the gross profit margins for major manufacturers are estimated to range between 28% and 40%.
