The global Injectable Implant Urinary Incontinence Device market size is predicted to grow from US$ 128 million in 2025 to US$ 183 million in 2031; it is expected to grow at a CAGR of 6.1% from 2025 to 2031.

Injectable implants are injections of material into the urethra to help control urine leakage (urinary incontinence) caused by a weak urinary sphincter. Injectable therapy using bulking agents composed of synthetic materials, bovine collagen, or autologous substances augment the urethral wall and increase urethral resistance to urinary flow. The injection of bulking agents to treat a dysfunctional urethra is a minimally invasive method of correcting intrinsic sphincteric deficiency that results in stress urinary incontinence but is being performed less frequently in current practice.

According to our research, the global market for medical devices is estimated at US$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing awareness about early disease diagnosis and treatment.
