Injectable microsphere fillers are skin fillers that are applied through injection, with their primary component being microspheres made of various biocompatible materials. These microspheres are uniformly distributed within the dermis, providing immediate volume support and stimulating the skin's natural collagen regeneration, thereby improving skin texture and elasticity. Characterized by ease of application, short recovery times, and long-lasting effects, they are suitable for various cosmetic needs including facial wrinkles, skin laxity, depressed scars, and facial contouring. Their unique microparticle structure results in a more natural filling effect, reducing the risk of overfilling.
