Injection general anesthetics are a class of medications administered intravenously to induce a state of unconsciousness and insensitivity to pain during surgical procedures. These drugs work by rapidly and effectively altering brain function to produce loss of awareness and sensation. Unlike inhalational anesthetics, which are administered through the respiratory system, injection general anesthetics are delivered directly into the bloodstream, allowing for precise control over the depth and duration of anesthesia. Examples include propofol, which is known for its rapid onset and short duration of action, and thiopental, which has a longer history of use. These medications are crucial for various medical and surgical interventions, ensuring that patients remain comfortable and immobile throughout procedures.

The global Injection General Anesthetics Drug market size is projected to grow from US\$ 2745 million in 2024 to US\$ 3420 million in 2030; it is expected to grow at a CAGR of 3.7% from 2024 to 2030.
