The increasing burden of obesity and growing awareness towards the fat reduction procedures among obese individuals is expected to create a huge growth opportunity for injection lipolysis market around the globe. Lipotherapy or injection lipolysis is a minimally invasive procedure used for the breakdown of fat cells around the injection sites.

Injection lipolysis is also applied in cosmetic surgeries to the patients to reduce the number of fat cells. Injection lipolysis is a non-surgical alternative in which drug mixtures such as deoxycholic acid, in combination with vitamin E, l-carnitine, collagenase, isoproterenol, and hyaluronidase are injected to destroy fat cells.

According to WHO world health statistics report in every six adult one is obese globally and the ratio is also gradually increasing which is expected to create huge growth opportunity for injection lipolysis market. So many surgical procedures are being followed by the obese population, however, the increasing demand for non-invasive procedures also anticipated to accelerate the injection lipolysis market growth.

In April 2015, U.S. FDA approved the deoxycholate acid injection Kybella of Kythera Biopharmaceuticals, Inc. which made the injection lipolysis procedure one of the mainstream minimally invasive technique for body fat loss. The injection lipolysis technique for fat loss is well adopted in European and American countries from the last couple of years while the adoption is a little low in Asia pacific regions.

Growing prevalence of diabetes, obesity and demand for cosmetic surgeries for fat reduction is expected to accelerate the injection lipolysis market growth over forecast years. However, safety concerns due to some side effects of injection lipolysis

procedure and the presence of other fat breakdown techniques are also expected to hamper the injection lipolysis to some extent.
