Abstracts

The global Inline Soft Starters market size is predicted to grow from US$ 3361 million in 2025 to US$ 4790 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

Inline Soft Starters are electrical devices integrated directly into a motor's power circuit to manage the starting and stopping phases of AC induction motors. By controlling the voltage supplied to the motor during startup, they enable a gradual increase in power, which reduces inrush current, mechanical stress, and electrical disturbances. Unlike bypass soft starters, inline soft starters maintain control throughout the motor's operation or until a separate bypass takes over. They are widely used in applications requiring smooth acceleration and deceleration, enhancing motor longevity and system reliability.

Inline Soft Starters typically feature a rated voltage range of 200V to 690V AC and handle motor power from around 3 kW up to 1000+ kW, with current ratings spanning 8A to 1600A. They offer adjustable start/stop ramp times (1–120 seconds), initial voltage settings (30%–70%), and current limiting (150%–600%). Many models include integrated bypass contactors and protections such as overload, phase loss, stall, and undervoltage/overvoltage safeguards. Advanced units provide communication options like Modbus or Profibus and are built with ingress protection from IP20 to IP54, operating effectively in ambient temperatures from –10°C to +50°C, with CE, UL, and other global certifications.
