## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

An ID clamp is a cutting jig. After centering a workpiece with a hole for location, the clamping jig secures the workpiece from the inside by the wall of the hole. The mouth part of the clamp is divided into several parts, which are spread by the clamping operation to fix the ID clamp on the inside diameter of the workpiece. By clamping the workpiece only from the inside, interference between the clamping jig and the machining tool is avoided, making it suitable for clamping workpieces with many machining points, multiple-piece machining, and thin-walled parts.
