The global Inorganic Pigments for Enamel market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

There are various types of pigments, including inorganic pigments and organic pigments. Inorganic pigments are mainly made from natural minerals or artificially synthesized inorganic compounds, which have excellent light resistance, weather resistance, chemical corrosion resistance, as well as high covering and coloring power. Organic pigments are mainly obtained from plants, marine animals, or chemical synthesis, and have bright colors and good coloring power. However, compared to inorganic pigments, organic pigments typically have poorer light resistance, weather resistance, and chemical corrosion resistance. In the enamel industry, inorganic pigments are widely favored due to their high temperature resistance. Due to the inability of organic pigments to withstand high temperatures, they are prone to chemical reactions or volatilization in high-temperature environments. In the production process of enamel products, high-temperature enamel firing is required, usually at around 800 degrees Celsius. Therefore, inorganic pigments have significant advantages in enamel applications. Enamel is a protective layer formed by coating a hard glaze on a metal surface and sintering it at high temperatures to resist acid, alkali, and wear. Inorganic pigments are mainly used to make enamel glazes, endowing enamel products with various bright colors and unique effects.

The application of inorganic pigments in the enamel industry mainly includes the following aspects: color adjustment: Inorganic pigments can achieve the purpose of adjusting the color of enamel products by adjusting the composition and proportion of pigments. Especially for metal oxide mixed phase pigments, unlike traditional inorganic

pigments, they have rich colors and complete chromatography. Different varieties of inorganic pigments can produce various shades, including bright colors such as red, yellow, blue, and green. Corrosion resistance and wear resistance: As enamel products are mainly used to protect metal surfaces from corrosion and wear, the chemical components in inorganic pigments often have corrosion resistance and wear resistance. These characteristics can improve the service life and durability of enamel products. Aesthetic effect: Inorganic pigments can help enamel products achieve a beautiful appearance. For example, metal pigments in effect pigments (inorganic) can create a mirror effect with a metallic texture. Meanwhile, inorganic pigments can also create various patterns and designs, enhancing the aesthetic appeal of products. Thermal stability: Due to the high temperature sintering required for enamel products, inorganic pigments must have good thermal stability and not decompose or fade at high temperatures. This can ensure that the color of enamel products is long-lasting and will not deform.
