The global Inorganic Scintillators market size is predicted to grow from US\$ 285 million in 2025 to US\$ 368 million in 2031; it is expected to grow at a CAGR of 4.4% from 2025 to 2031.

Inorganic Scintillators are crystals grown in high temperature furnaces and are made of Alkali Halides (i.e., NaI, CsI) or Oxides (i.e., BGO), etc. They have scintillation properties by virtue of their crystalline structure. This structure creates the energy bands between which electrons can jump up to higher energy levels by excitation through ionizing radiation or down to lower energy levels by de-excitation through the emission of (visible) photons. The result is known as the scintillation effect. Some crystals need activators to enable scintillation emission in the visible part of the spectrum. An example of such an activator is Thallium (Tl), which is used in the best known and most frequently used Inorganic Scintillator: NaI(Tl).

Global key players of Inorganic Scintillators include Hamamatsu Photonics, Hitachi Metals, Saint-Gobain Crystals, etc. The top three manufacturers hold a share about 44%. The global Inorganic Scintillators are mainly produced in Japan, Europe and United States, they occupied for a share over 60%. Asia-Pacific is the largest market, has a share about 47%, followed by North America and Europe, with share 25% and 20%, separately.
