Inorganic solid-liquid phase change materials are a special class of materials that can undergo a reversible phase change from solid to liquid at a specific temperature (i.e., phase change temperature), and absorb or release a large amount of heat in the process, while the temperature of the material remains almost unchanged. This material has a wide range of application prospects in energy storage, building temperature control, aerospace and other fields due to its unique heat storage and heat release properties. For example, in the field of construction, they can be used in building components such as walls, roofs and floors to effectively regulate indoor temperature by absorbing and releasing heat energy; in the field of energy storage, they can be used for the storage and utilization of renewable energy such as solar energy and wind energy; in the field of aerospace, they can be used in the thermal control system of spacecraft to ensure the normal operation of spacecraft in extreme temperature environments.

The global Inorganic Solid-liquid Phase Change Material market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
