The global Inosine Acedoben Dimepranol Drugs market size is predicted to grow from US\$ 252 million in 2025 to US\$ 329 million in 2032; it is expected to grow at a CAGR of 3.9% from 2026 to 2032.

Inosine Acedoben Dimepranol is an antiviral drug that is a combination of inosine and dimepranol acedoben (a salt of acetamidobenzoic acid and dimethylaminoisopropanol) in a ratio of 1 to 3. It is used for its immunomodulatory properties and is believed to enhance the body's immune response. Isoprinosine is used in the treatment of various viral infections and immune-related disorders, although its exact mechanisms of action are not fully understood

Market driver for the Isoprinosine is its well-established history as an antiviral and immunomodulatory drug. Isoprinosine's efficacy in treating various viral infections, such as herpes simplex and viral hepatitis, has made it a preferred choice for healthcare providers and patients seeking effective antiviral treatments. Its immunomodulatory properties, which enhance the body's immune response, have also contributed to its popularity. Moreover, in times of emerging viral threats, such as the COVID-19 pandemic, Isoprinosine gained attention as a potential treatment option, further boosting its market demand. As research continues to explore its applications in other immune-related conditions, Isoprinosine's market presence is likely to expand.
