## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

This kit uses a unique lysate that can effectively remove polysaccharides, polyphenols, etc. It can extract DNA from insects, mollusks, arthropods, roundworms and other samples. Samples stored in alcohols are also suitable for the extraction of this kit. One operation can process tissues less than 50Chemicalbookmg. The sample is digested by the lysate, and most of the polysaccharides and polyphenols are separated and removed by chloroform. After further purification by the separation column, high-purity DNA can be obtained. The obtained DNA can be used in PCR, Southern hybridization, enzyme digestion and other experiments.

The global market for Insect Genomic DNA Extraction Kit is estimated to increase from US\$ million in 2021 to reach US\$ million by 2028, exhibiting a CAGR of % during 2022-2028. Keeping in mind the uncertainties of COVID-19 and Russia-Ukraine War, we are continuously tracking and evaluating the direct as well as the indirect influence of the pandemic on different end use sectors. These insights are included in the report as a major market contributor.

The Insect Genome DNA Extraction Kit is specially designed for extracting genomic DNA from lower non chordate animals such as insects, including some plant tissues. This method combines the CTAB splitting method Chemicalbook and silica gel column purification method, which can effectively remove various pigments, chitin, polysaccharides and other impurities. The purified DNA can be directly used in PCR, Southern hybridization, enzyme digestion and other subsequent experiments
