## Abstracts

The global Insect Pheromone Trap market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

An Insect Pheromone Trap is a device used in pest management to attract and capture specific types of insects, typically using synthetic pheromones to mimic the scent of female insects. Pheromones are chemicals emitted by insects to communicate for mating or marking territories. The trap lures the male insects, preventing them from mating and disrupting their reproductive cycle. This method is widely used in agriculture, forestry, and food storage facilities to monitor and control insect pests in an environmentally friendly and targeted manner.

The industry trend for Insect Pheromone Traps is moving towards technological advancements, including more efficient lure designs, trap materials, and monitoring systems. Manufacturers are developing traps with improved durability, ease of use, and eco-friendly materials. Additionally, there is a focus on integrating digital monitoring and remote sensing capabilities to provide real-time data on pest populations and trap effectiveness, allowing for more precise and proactive pest management strategies.
