An implantable loop recorder (ILR), also known as an insertable cardiac monitor, is a small device about the size of a pack of chewing gum or USB memory stick that is implanted just under the skin of the chest for cardiac monitoring. The most common ones include looking for causes of fainting, palpitations, very fast or slow heartbeats, and hidden rhythms that can cause strokes. During a loop recorder implantation, your heart healthcare provider (cardiologist) does a minor procedure.

Increasing incidence of atrial fibrillation (AF): AF is a common arrhythmia that affects a significant number of individuals worldwide. The condition is characterized by an irregular heartbeat and can lead to stroke, heart failure, and other serious health problems. The demand for insertable cardiac monitors is expected to rise significantly

due to the increasing incidence of AF and the need for long-term monitoring to detect and manage the condition effectively.

**Improved patient outcomes:** Insertable cardiac monitors are designed to provide continuous monitoring of heart rhythm and function, enabling earlier detection of arrhythmias and other cardiac events. This can lead to earlier intervention and treatment, reducing the risk of stroke, heart failure, and other serious health consequences. As a result, the demand for insertable cardiac monitors is expected to grow significantly as patients and healthcare providers recognize the benefits of long-term monitoring for improving patient outcomes.

**Technological advancements:** Insertable cardiac monitors have undergone significant technological advancements in recent years, including improved battery life, smaller size, and enhanced diagnostic capabilities. These advancements have made the devices more comfortable for patients to wear and more effective in detecting cardiac events, further driving market growth.
