The inside rail hoist is a loading system installed on both sides of the inside of the roll-off truck frame. Its slide rail structure is located on the 'inner rail' of the frame and is used to lift, load and unload containers such as garbage bins and waste bins, as well as roll them. Compared with the outer rail type, the inner rail hoist is more compact, allowing the width of the equipment to be controlled inside the truck frame. It is suitable for application scenarios with strict requirements on the width and maneuverability of the entire vehicle, such as narrow areas of urban roads, small transfer stations, and light transport vehicles. Inside rail hoists usually have a lower dead weight and faster loading and unloading speeds, and their load capacity is usually between 15,000 and 25,000 pounds, making them suitable for small and medium-sized waste or recycling operations. It is often used in light roll-off trucks and is a common configuration in cleaning systems in North America and some European cities. Although its structure limits its heavy-load capacity, it has obvious advantages in flexibility, economy, and urban adaptability.
