Insoluble sulfur (IS) is a sulfur polymer used as a vulcanizing agent in the automotive industry, which is essential for improving the durability of rubber. IS is available in oil-filled and non-oil-filled types and improves abrasion resistance, fatigue resistance, and aging resistance of rubber products. It is widely used in automotive parts, latex, rubber hoses, shoes, cables and belted tires. Because of its non-foaming properties, IS is preferred for radial and light-colored rubber products and is ideal for applications where ordinary sulfur is not suitable.

The expanding electric vehicle (EV) market presents a significant opportunity for the insoluble sulfur market. EVs require specialized tires to handle high torque and unique driving conditions. For example, tire manufacturers such as Michelin and Bridgestone use insoluble sulfur to improve the durability and performance of EV tires. The specialization of this tire ingredient supports the growth of the insoluble sulfur market as more and more automakers adopt electric vehicle technology.
