The global Insolubles Titanium Anodes market size is predicted to grow from US\$ 1603 million in 2025 to US\$ 2683 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

Insoluble titanium anodes are composed of a titanium substrate coated with an electro-catalytic layer. There are usually two types of coating: platinum or based on mixed metallic oxides (commonly known as MMO).

As the core component of the electrolysis process, the performance of the insoluble titanium anode directly determines the electrolysis efficiency, product quality and energy consumption level, and has a key impact on the production costs and benefits of downstream companies.

Electrolysis technology is the use of electrochemical principles to electrolyze salt solutions through anodes and cathodes to achieve the preparation of new materials. The electrolysis products are important raw materials for the national economy. With the continuous development of electrolytic product technology, electrode materials have also experienced three generations of technological innovation and development due to their own characteristics. The third generation titanium-based insoluble electrodes have strong corrosion resistance and are more green, energy-saving and efficient. With the improvement of people's environmental awareness, efficient, green and energy-saving titanium anodes will inevitably develop strongly to replace traditional electrodes. At the same time, the proportion of new fields such as water electrolysis to produce hydrogen is gradually increasing, and the market space for related electrode materials in the future is broad.
