Insulation washers are specialized washers designed to provide electrical insulation between two conductive materials. They are typically made from non-conductive materials such as plastic, rubber, or porcelain, and they are used to prevent the flow of electrical current where it is not desired, such as in electrical connections and installations. The primary purpose of an insulation washer is to create a barrier that prevents electrical components from coming into direct contact with each other or with conductive surfaces, which could lead to short circuits, electrical arcing, or other hazardous conditions. Insulation washers are often used in conjunction with screws, bolts, and other fasteners to secure electrical devices and components while maintaining electrical insulation. In summary, insulation washers are a critical safety feature in any application where electrical conductivity needs to be controlled or isolated to prevent electrical hazards and ensure the reliable operation of electrical systems.
