The integrated anti-interference navigation receiver is a navigation receiver that integrates an anti-interference module and a navigation module. It can ensure the normal reception and processing of satellite navigation signals in strong interference environments and improve the reliability and accuracy of navigation and positioning. . The working principle of the integrated anti-interference navigation receiver is to use digital signal processors and algorithms to perform real-time interference detection, identification, suppression and elimination of satellite navigation signals, while simultaneously capturing, tracking, demodulating and solving signals to obtain position, Information such as speed and time. The advantages of the integrated anti-interference navigation receiver are compact structure, stable performance, simple operation, and ability to adapt to various complex interference scenarios. The disadvantages of the integrated anti-interference navigation receiver are high equipment cost, high power consumption, and the need for professional design and debugging.
