A graphics processing unit (GPU) is a specialized electronic circuit designed to rapidly manipulate and alter memory to accelerate the creation of images in a frame buffer intended for output to a display device.

In recent years, GPU technology has developed rapidly, and the performance of integrated GPUs has continued to improve. For example, they have advantages in parallel processing and general computing, allowing them to meet the needs of more fields. In addition, with the advancement of packaging and manufacturing technology, the size and power consumption of integrated GPUs are continuously reduced, but the performance is continuously improved. With the popularity of mobile devices and the increasing demand for games, learning and other applications, the demand for graphics processors is also growing. Under this trend, the market share of integrated GPUs is also expected to continue to grow. Although standalone GPUs dominate the current market, the hybrid segment is expected to achieve the highest CAGR in the future due to the capabilities of hybrid GPUs having both integrated and dedicated GPUs.
