The global Integrated Optical Gyroscope market size is predicted to grow from US$ 705 million in 2025 to US$ 1154 million in 2031; it is expected to grow at a CAGR of 8.6% from 2025 to 2031.

The integrated optical gyroscope is an angular velocity sensor based on the principle of optical interference. It uses the interference effect of light waves in a ring waveguide (or fiber ring) to measure the angular velocity of the carrier relative to the inertial space. When the gyroscope rotates, a phase difference will be generated between the two beams of light waves propagating in opposite directions inside. This phase difference is proportional to the angular velocity of the rotation. By measuring this phase difference, the magnitude of the angular velocity can be inferred.

United States market for Integrated Optical Gyroscope is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Integrated Optical Gyroscope is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
