The global Integrating Sphere Spectroradiometer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An integrating sphere spectroradiometer is an instrument used to measure the radiation spectrum of a light source. Its working principle is to introduce the light emitted by the measured light source into a spherical collector (integrating sphere). After multiple reflections, the light is evenly scattered within the sphere wall to achieve the effect of uniform mixing of light. Subsequently, the light that has been uniformly mixed in the integrating sphere is measured by a photodetector installed on the integrating sphere to obtain the radiation spectrum data of the light source. Integrating sphere spectroradiometer can be used to measure the radiation spectrum of various light sources, including LED lamps, fluorescent lamps, fluorescent lamps, lasers, etc. By measuring the radiation spectrum of the light source, we can understand the luminous characteristics of the light source, such as spectral distribution, luminous intensity, etc., and thereby evaluate the color quality, brightness, energy efficiency and other indicators of the light source. In the LED industry, integrating sphere spectroradiometers are often used to test the optical performance of LED light sources, such as measuring the spectral distribution, color temperature, color index (CRI), luminous flux and other parameters of LEDs. By using integrating sphere spectroradiometers, LED manufacturers can evaluate and optimize the optical performance of their products to ensure that the optical quality of LED lamps meets market needs and standard requirements.
