Intensified CCD (ICCD) cameras use a CCD sensor combined with an intensifier. They are optimal for low-light or single photon applications due to the electron multiplying component of the intensifier. They are also ideal for applications which require less than nanosecond exposure time, such as laser induced breakdown spectroscopy or fluorescent lifetime imaging microscopy due to the intensifier's ability to rapidly close the shutter while still converting any photons detected into photoelectrons.

The global Intensified CCD Camera market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
