Interactive Application Security Testing (IAST) software examines and analyzes an application's code from within to find security vulnerabilities while the application is running. This testing approach differs from static application security testing (SAST), which does not require actual execution of the application's code, and dynamic application security testing (DAST), which uses a black-box testing approach to perform testing from outside the application. Compared to SAST, IAST is a faster method of testing code, which is preferable for teams looking to enhance their continuous delivery practices. However, the real-time speed of IAST software comes with relatively less thorough scanning technology. Unlike SAST software, which analyzes the entire code base, IAST only executes at specific tester-defined points. IAST software notifies testers when a vulnerability is discovered and provides remediation recommendations to help the team resolve the issue.

The global Interactive Application Security Testing (IAST) Software market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
