## Abstracts

The global Interference Screws market size is predicted to grow from US\$ 444 million in 2025 to US\$ 722 million in 2031; it is expected to grow at a CAGR of 8.5% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Interference screws are mainly used in ligament reconstruction surgery (such as anterior/posterior cruciate ligament reconstruction). They are made of metal or absorbable materials to fix the transplanted tendon or artificial ligament in the bone canal, and mechanical compression is used to achieve a stable combination of bone and transplant. Its advantage is rigid fixation, which is suitable for bone-tendon interface fixation and can reduce graft sliding. It is commonly used in arthroscopic surgery and is a key consumable in the field of sports medicine.

Polyetheretherketone (PEEK) has become an important choice for non-absorbable screws because its elastic modulus is close to that of bone tissue and can reduce stress shielding, especially for high-load areas (such as knee repair). In addition, composite materials (such as PLLA/?-TCP) combine degradation and osteoinductivity to further optimize mechanical properties and bioactivity.

Absorbable interface screws (such as polylactic acid PLA, magnesium alloy) have gradually become mainstream due to their biocompatibility and the advantage of not requiring secondary surgery. For example, magnesium alloy screws can release magnesium ions when degraded in the body, promoting bone regeneration, and have made progress in clinical trials (such as Yian Technology's degradable magnesium interface screws have completed 39 cases of group trials).

Under the policy background of the country's strong support for the localization of medical devices, more and more local companies have invested in the research and development and production of interface screw products. Some high-end domestic screws have gradually approached or surpassed the international advanced level in terms of performance, material application, and clinical indication expansion, which has promoted the process of import substitution.

With the popularization of sports, the improvement of national health awareness, and the accelerated aging of the population, the number of surgeries such as anterior cruciate ligament (ACL) reconstruction, rotator cuff repair, and soft tissue reconstruction has continued to grow, directly driving the demand for interface screw products.

In order to meet the needs of different types of soft tissue repair and different patients, interface screws are continuously optimized in terms of specifications, dimensions, thread design, self-tapping performance, guide wire guidance and other details, gradually forming multiple subcategories such as standard, self-tapping, tapered, slotted, and bone block-specific.
