The global Interior Wall Inorganic Coating Emulsion market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Interior wall inorganic coating emulsions mainly use inorganic materials such as inorganic silicates and other minerals as film-forming substances, and have good air permeability, water resistance, weather resistance and alkali resistance.

As people pay more and more attention to indoor air quality, inorganic functional coatings that can effectively decompose formaldehyde and generate negative ions are becoming more and more popular among Chinese consumers. The inorganic coatings market is gradually growing, and industry standards and competition order also need to be standardized. In recent years, there have been constant reports of harmful substances in chemical organic coatings exceeding standards and large areas falling off and causing mold. People have begun to be skeptical of traditional coating products. It is undeniable that chemical organic interior wall coatings do have shortcomings in terms of physical and chemical properties, such as being easy to crack, easy to pollute, easy to get damp and moldy, etc. Therefore, inorganic coatings using silica plus functional materials have emerged, and more and more inorganic functional Paint brands are also emerging. In developed European and American countries such as the United States and Germany, more than 93% of households use inorganic coatings. However, domestic inorganic coatings currently only account for less than 5% of the market share of wall decoration materials. They also have a huge market share. Expansion capacity.
