Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The intermittent cartoning machine is a kind of equipment that during the automatic cartoning process, after each carton is completed, it will stop working, wait for the arrival of the next product, and then start the next work. The working characteristic of this cartoning machine is the reciprocating motion of a single head of the transmission chain, with one stop and one movement forming a cartoning cycle. Its production speed is relatively slow, generally 50 to 100 boxes/minute. It is difficult to break through the speed limit of 100 boxes/minute, because after exceeding this speed, the stability of the equipment will become very poor and it will not be able to meet the production needs of the market. .

The global Intermittent Cartoning Machine market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
