Intermittent Pneumatic Compression (IPC) Device are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Intermittent Pneumatic Compression (IPC) Device. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Intermittent Pneumatic Compression (IPC) Device market.

An intermittent pneumatic compression device is a device used to deliver intermittent external pressure therapy to patients. This device is usually used to prevent deep vein thrombosis or treat symptoms such as limb edema. Its working principle is to promote blood circulation, reduce venous pressure, and reduce congestion and edema through the application of appropriate periodic pressure.

Intermittent pneumatic compression devices consist of one or more cuffs that apply pressure to a patient's limbs in turns. When the device is activated, a compressed air

pump creates air pressure that sends air into the cuff, inflating the cuff and applying pressure to the patient's limbs. After pressure is applied for a period of time, the air sleeve releases the pressure and expels the air in preparation for the next application of pressure. Intermittent pneumatic compression devices are typically operated by medical professionals and adjusted and monitored based on the patient's specific condition and needs.
