With recovery from influence of COVID-19 and the Russia-Ukraine War, Internal & External Circulation Ball Screw are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Internal & External Circulation Ball Screw. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Internal & External Circulation Ball Screw market.

Internal/external circulation ball screws are mechanical transmission devices used to convert the rotary motion into the linear motion, the difference lies in the way the balls circulate.

The ball retainer and ball circulation channel of the internal circulation ball screw are located inside the threaded screw, and the balls only circulate inside the threaded screw during the rolling process, and will not break away from the screw. The ball retainer and ball circulation channel of the outer circulation ball screw are located outside the nut.

During the rolling process, the ball circulation channel inside the threaded screw enters the ball circulation channel of the nut, and then returns to the inside of the threaded screw for circulation. When selecting a ball screw, it is necessary to comprehensively consider factors such as the application environment, load requirements, accuracy requirements, and available space, and select the appropriate type and specification according to actual needs. At the same time, regular maintenance and lubrication are also important measures to ensure the performance and life of the ball screw.
