The internal iliac stent graft system is a medical device specially designed for the treatment of iliac artery diseases. The internal iliac stent graft system usually consists of two parts: a stent graft and a delivery system. The stent graft consists of a metal stent and a membrane material (such as polyester film, polytetrafluoroethylene, etc.) covering the surface of the stent, and the whole is cylindrical. The delivery system is used to accurately deliver the stent graft to the lesion site and release it. The metal stent provides the necessary support to maintain the patency of the blood vessels. The membrane material covers the metal stent to form a barrier that can effectively isolate the direct contact between the blood and the blood vessel wall, prevent blood from leaking into the adjacent tissues, and thus protect the damaged area from further damage.
