An internal overrunning clutch is a mechanical power transmission component that allows torque transfer in one rotational direction while automatically disengaging in the opposite direction. Its compact internal structure enables integration into gearboxes, motors, and drivetrains where space and reliability are critical.

The industrial chain includes upstream suppliers of alloy steel, precision bearings, springs, friction elements, and heat-treatment materials. The midstream consists of clutch manufacturers performing machining, grinding, hardening, assembly, and functional testing. Downstream applications include automotive transmissions, industrial gearboxes, conveyors, electric motors, agricultural machinery, and construction equipment.

United States market for Internal Overrunning Clutch is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
