An internally fused capacitor is a specially designed capacitor with an integrated fuse as an additional overcurrent protection device. Generally, capacitors may be affected by overload current during operation. Without appropriate protection measures, overload may cause capacitor damage or failure. To prevent this from happening, internally fused capacitors are designed with a fuse inside them that breaks the circuit in the event of an overcurrent, preventing the capacitor from being damaged. This design can enhance the safety and reliability of the capacitor, protect the capacitor from damage by overload current, and extend its service life. Internally fused capacitors are commonly used in a variety of circuits, especially in applications where additional protection of the capacitor is required.

The global Internally Fused Capacitor market size is projected to grow from US\$ 197 million in 2024 to US\$ 306 million in 2030; it is expected to grow at a CAGR of 7.6% from 2024 to 2030.
