The global Internally Heating Electric Soldering Iron market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The internal heating soldering iron is another common electronic welding tool. Its characteristic is that the heating resistor (i.e. the soldering iron core) is installed inside the soldering iron tip, and the heat is directly transferred to the soldering iron tip by internal heating. The internal heating soldering iron consists of a handle, a connecting rod, a spring clip, a soldering iron core, and a soldering iron tip. Since the soldering iron core is installed inside the soldering iron tip, it has the advantages of fast heating and high heat utilization. The common specifications of the internal heating soldering iron include 20W, 50W, etc. Although its power seems not high, due to its high thermal efficiency, a 20W internal heating soldering iron may be equivalent to a 40W external heating soldering iron in actual use.

The internal heating soldering iron is small in size, light in weight, low in power consumption and easy to use, and is particularly suitable for occasions that require fine welding. It is also convenient to replace the soldering iron tip. The hollow design at the rear end allows the soldering iron tip to be sleeved on the connecting rod and fixed with a spring clip. When the soldering iron tip needs to be replaced, just withdraw the spring clip and gently pull out the soldering iron tip.

United States market for Internally Heating Electric Soldering Iron is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
