The main concept behind the application of interphase spacer system is to prevent the most dangerous consequence from conductor galloping, namely phase-to-phase short-circuits. Attaining this is relatively straightforward and involves providing in-span mechanical couplings between phases, thereby maintaining phase-to-phase clearances at some pre-determined, acceptable limit. Moreover, from the oscillation damping point of view, these devices provide further benefit by limiting any torsional (twisting) motion

of conductors or conductor bundles. Interphase spacers are applied to maintain constant distance between phases of an overhead line. The most frequent situations where these find application are where a line is exposed to strong winds and snowstorms that can generate ice sleeves on conductors.
