Interspinous spacers sometimes also called as Interspinous process decompression systems, are the devices implanted between vertebral spinous processes. These spacers are made up of a very strong but lightweight metal (titanium) which is biocompatible in the human body. These devices are imbedded in body to confine painful motion else enabling normal motion and to treat lumbar spinal stenosis, discogenic low-back pain, facet syndrome, disc herniations, and non-traumatic instability. Lumbar spinal stenosis is a thinning of the spinal canal in the lower back which causes compression on nerves and it is developed gradually with age. Radiology tests are used to confirm a diagnosis of moderate degenerative lumbar spinal stenosis. People with lumbar spinal stenosis experience pain but may also have weakness in their leg, lower back and buttocks, numbness, tingling.
