Interventional tumor ablation is a minimally invasive medical procedure performed to treat certain types of tumors. It involves the use of various techniques to destroy or eliminate tumors without the need for open surgery. The goal of interventional tumor ablation is to selectively target and destroy tumor cells while minimizing damage to surrounding healthy tissues.

There has been an increasing demand for minimally invasive treatment options for tumors. Interventional tumor ablation techniques, such as radiofrequency ablation, microwave ablation, cryoablation, and laser ablation, offer less invasive alternatives to traditional surgery. Patients often prefer these procedures due to their shorter recovery times, reduced complications, and the potential to preserve organ function.
