Abstracts

The global Intestinal Obstruction Catheter market size is predicted to grow from US$ 216 million in 2025 to US$ 321 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Intestinal obstruction catheters are long medical drainage tubes specifically designed to treat adhesive or functional intestinal obstruction. Guided by X-ray or endoscopy, they pass over the obstruction site to achieve intestinal decompression, drainage of fluid, and recanalization. The upstream of the industry chain includes suppliers of medical polymer materials (such as polyurethane and silicone), contrast rings (platinum-iridium alloy), guidewires, and precision extrusion equipment. The midstream consists of R&D and manufacturing companies with Class III medical device qualifications, requiring mastery of core technologies such as multi-cavity molding, surface lubrication coating, and biocompatibility control. The downstream primarily targets hospital general surgery, gastroenterology, and interventional radiology departments, entering clinical practice through distributors, hospital bidding, or self-funded channels. Due to the high technical barriers, clear clinical value, and the fact that centralized procurement is not yet fully implemented, the overall gross profit margin of the industry is typically between 50% and 70%, with imported brands having higher gross profit margins. Domestic companies with independent material processing and precise catheter placement solutions are accelerating substitution and maintaining high profitability. In 2024, the global production of intestinal obstruction catheters was approximately 338,700 units, with a global average market price of approximately US$620 per unit. The gross profit margin of major companies in the industry is between 42% and 58%. The production capacity of a single line is 10,000 to 20,000 pieces per year.
