In 2024, the global 's total production capacity of Intracavitary Pneumatic Lithotripter reached 5,400 units.The industry average gross profit margin of this product reached 37%.

The Intracavitary Pneumatic Lithotripter is a medical device widely used in fields such as urology. It enters the body cavity through an endoscope and uses physical mechanical energy to break up stones, providing a highly efficient and minimally invasive treatment option for stone patients. Upstream raw materials mainly include stainless steel and nickel-titanium alloys needed to manufacture core components such as probes and handpiece impact pins. Nickel-titanium alloys, due to their "superelasticity," are a key material for flexible endoscope probes, presenting a high technological barrier. Medical polymer materials are used to manufacture various catheters, seals, and component housings, requiring good biocompatibility and mechanical properties. Electronic components, including chips, circuit boards, sensors, and wiring harnesses, are the brain and nerves of the control unit and host. The midstream is the core of the industry chain, responsible for transforming upstream raw materials and components into final products. The "host + consumables" model: This is a very classic business model. The OEM may sell the host at a relatively reasonable price, but obtains long-term profits through the continuous sale of proprietary probe models and other consumables. Downstream end users are mainly medical institutions
