Intraluminal Guide Plate is a personalized tool used in medical procedures to precisely position and guide surgical instruments, playing a particularly important role in brachytherapy and minimally invasive interventional procedures. Upstream 3D printing materials mainly consist of photosensitive resins (such as biocompatible resins used in SLA) and engineering plastics (such as PLA, ABS, PA nylon, etc.). These materials need to possess biocompatibility (at least meeting skin contact standards), sufficient strength, precision, and printability. 3D printing equipment manufacturers provide industrial-grade 3D printers using technologies such as SLA (solar curing), DLP (digital light processing), and FDM (fused deposition modeling). The midstream is the core of the industry chain, a crucial link in transforming upstream resources into concrete products, and also the main part of value creation. These companies may be independent third-party service providers or design service departments of 3D printing companies. The downstream is the outlet of the industry chain, determining the market value and final implementation of the product. End users are mainly hospital departments such as radiotherapy, interventional radiology, orthopedics, and neurosurgery.
